

THE STATE OF AMERICA'S CHILDREN®

ABOUT THE CHILDREN'S DEFENSE FUND

The Children's Defense Fund envisions a nation where marginalized children flourish, leaders prioritize their well-being and communities wield the power to assure they thrive. To realize this vision, we pursue a movement-building and institutional growth strategy to build power for child-centered public policy, informed by racial equity and the lived experience of children and youth.

Our Leave No Child Behind[®] mission is to ensure every child a *Healthy Start*, a *Head Start*, a *Fair Start*, a *Safe Start* and a *Moral Start* in life and successful passage to adulthood with the help of caring families and communities.

We serve and advocate for the largest, most diverse generation in America: the 73 million children and youth under the age of 18 and 30 million young adults under the age of 25, with particular attention to those living in poverty and communities of color.

Acknowledgments

The CDF team responsible for the work on this report included:

Loy Azalia, Senior Research Associate Sierra Campbell, Special Assistant Anourack Chinyavong, Graphic Designer Ben Dawson, Webmaster Mina Dixon Davis, Policy Associate Emily Gardner, Communications Director Teri Hatch, Digital Communications Manager Kathleen King, Interim Policy Director Emma Mehrabi, Director of Poverty Policy Steven Olender, Senior Policy Associate for Child Welfare and Mental Health Beki San Martin, Communications Associate Austin Sowa, Policy Associate Stefanie Sprow, Director of Child Welfare Policy Zach Tilly, Policy Associate

A Note about Using The State of America's Children[®] 2021

The Children's Defense Fund fights for the largest, most diverse generation in America. We know that to succeed, children need stable homes, quality health care, ample nutritious food, good schools, safe neighborhoods, and access to resources and opportunities that enable them to reach their potential. But the fact is that for too many of our children, these basic building blocks for success are out of reach. As we urge policymakers to prioritize child-centered solutions that create equitable conditions in which all young people can thrive, our work must be grounded in data and facts. As our children continue to suffer from the harmful impacts of our country's health, economic, and racial disparities, which are now magnified by the COVID-19 pandemic, the challenges facing our young people are more daunting in every area.

This year's *State of America's Children®* report is unique in that the majority of the data included in the report reflect realities prior to the pandemic. The report is undergirded by specific data that were vital in reducing child poverty and taking other steps towards improving child well-being *before* the devastation caused by the COVID-19 pandemic, while also reflecting the deep racial and economic disparities that have long plagued our nation. To bridge the gap between the available data and current realities, each chapter includes a special section highlighting the impact of the COVID-19 public health and economic crisis on children. Taken as a whole, the report underscores the need for government data reporting agencies and other organizations to conduct more real-time data collection, reporting, and information dissemination if we as a nation are to meet the challenges facing our children and families. Throughout the report terms of race, identity, and experience reflect the original data source's language. This means from chapter to chapter, language usage may vary depending on the source of the data.

The State of America's Children[®] 2021 and corresponding state fact sheets provide an overview of how America's children are faring to inform conversations and improve policies to ensure no child is left behind.

- The State of America's Children® 2021 summarizes the status of America's children in 12 areas: child population, child poverty, income and wealth inequality, housing and homelessness, child hunger and nutrition, child health, early childhood, education, child welfare, youth justice, gun violence and immigration. For each area, we compiled the most recent, available national and state-level data. The report includes key findings as well as data tables, which are useful for comparing how children are faring in different states.
- Using data from the tables in *The State of America's Children®* 2021, our national and state factsheets each provide a one-page summary of how children are doing in all 50 states, the District of Columbia, and nationwide. Whether you identify as a teacher, child advocate, policymaker, policy wonk, college professor, faith leader, parent or grandparent, a millennial eager to make life better for your younger siblings, or a member of the media, we ask you to use *The State of America's Children®* 2021 to inform your conversations and effectively make the case for policies, programs, and strategies to improve the odds for children in your state and nationwide. We must keep moving forward in the fight for America's children.

INTRODUCTION

The year since the last publication of the Children's Defense Fund's *State of America's Children* report has felt more like a decade. Consequential changes in the nation's health, wealth, and leadership have occurred in ways that make the whole world seem different.

Shortly after last year's release, we were forced to respond to the most significant health pandemic in a century, which has now taken more than 500,000 American lives. The advent of COVID-19 initiated an economic crisis and restructuring from Wall Street to each of our homes. Shelter-in-place orders, mask mandates, and mandatory shifts to telecommuting have altered whole industries and impacted the trajectory of the future of work.

Meanwhile, last summer brought with it a racial reckoning years in the making. The largest mass mobilization for social justice in recent memory occurred as a historic presidential campaign took shape. More than 155 million citizens voted in an atmosphere infused with white nationalism and culminating in an attempted siege of the U.S. Capitol. The protracted struggle for democracy led to a change in partisan control of the federal government and a first in executive leadership for women, Black, and South Asian Americans.

Every aspect of American life in the social sector has been impacted by these shifts more quickly than data can track; even the most recent available data sets do not fully encompass how this past year has shaped our lives. This, of course, includes our 2021 *State of America's Children* report. Because, as one element of the report makes clear "Our Children are Not Immune."

Young People are Not Immune

Children are being impacted at every level: physically, economically, academically, socially, and psychologically. As we consider child well-being in this country, this year's report gives special attention to the various impacts of the pandemic.

- As of February 25, 2021, 3,168,274 total child COVID-19 cases had been reported, representing 13.1 percent of all cases.
- October 2020 data analysis by the Center on Poverty & Social Policy (CPSP) at Columbia University showed that an additional 8 million Americans—including 2.5 million children—have fallen into poverty since May 2020.
- As of February 2021, more than 1 in 7 adults with children (14.5 percent) reported that their children were not getting enough to eat—more than five times the pre-pandemic rate.

Chief among concerns more difficult to measure and monitor are the impacts on how our children are processing this dramatic change. But a <u>November 2020 report</u> from the Centers for Disease Control and Prevention (CDC) paints an important picture. By examining emergency room visits for mental health, the CDC found increases of between 24 and 31 percent for people under the age of eighteen, compared to the same period in 2019. Unfortunately, policies regarding reimbursement for services, coverage inequities, and cultural stigma have contributed to emergency departments being the frontline of support for children's mental health.

While more than 3 million children and youth have contracted the novel coronavirus in the United States, all 73 million are impacted by the sense of uncertainty and disruption of routine it has caused. Even the improvements in the second school year of online learning have not resolved concerns of social isolation and the loss of important life milestones, like graduation and the high school prom. This loss of certainty, consistent routine, and connection is leading to increased levels of depression and despair among our children and youth.

INTRODUCTION

Black youth are especially vulnerable to 2020's converging crises. COVID-19 and racial uprisings swept into Black communities wrestling with spiking child suicide rates. In December 2019, the Congressional Black Caucus's Emergency Task Force on Black Youth Suicide and Mental Health released <u>Ring the Alarm</u>. The report found that Black youth under 13 are twice as likely to die by suicide than their white counterparts and the suicide death rate for Black youth is increasing faster than any other racial or ethnic group.

Time for Healing, Imagination, and Action

A year marked by such dramatic change and drastic negative impact on children's lives must be followed by one of healing and restoration. This healing will require disciplined reflection, radical imagination, and bold action. Throughout the tumult of 2020, two of my most valued thought partners were the late writer and activist James Baldwin (with whom I share a deep intellectual resonance and a birthday) and Princeton professor Dr. Eddie Glaude, Jr.

Glaude reflected powerfully on "Jimmy's" life in his 2020 book, *Begin Again: James Baldwin's America and Its Urgent Lessons for our Own*. A revelation of critical import to me is Glaude's highlighting Baldwin's insight that times of reckoning and crisis call us to "do our first works over." This is an invitation to re-examine our foundational commitments, values, and stories to faithfully craft a future.

The Children's Defense Fund is walking this path of examination. The board and staff entered the year in discernment about the first leadership transition in our history. After having made the decision, we initiated a process of organizational, programmatic, and operational planning holding our "first works" and children's needs in conversation.

As a result, even in what President Biden has called a "dark winter" considering the pandemic, the **Children's Defense Fund envisions a nation where marginalized children flourish, leaders prioritize their well-being, and communities wield the power to ensure they thrive.** From where we currently stand, this is a radical vision. Yet, we are committed to work – with you – to make it happen.

Join us. Allow this data, compiled by our extraordinary public policy team, to inform your disciplined reflection. But don't stop there. Pause and imagine a country where flourishing children smile, sing, and dance. Talk to young people about what they desire for their lives. Then gather your neighbors, friends, and colleagues to work together and improve the state of America's children. We will be with you every step of the way.

For our children,

The Rev. Dr. Starsky Wilson President & CEO Children's Defense Fund

OVERVIEW

The State of America's Children® 2021

CHILD POPULATION: America's children are more diverse than ever.

- There were 73 million children in the U.S. in 2019–22 percent of our nation's population.
- In 2019, children of color made up 49.8 percent of all children and the majority of children under 5.

CHILD POVERTY: Children remain the poorest age group in America, with children of color and young children suffering the highest poverty rates.

- Nearly 1 in 7 children—10.5 million—were poor in 2019. Nearly 71 percent of poor children were children of color. More than 1 in 4 Black children and more than 1 in 5 Hispanic and American Indian/Alaska Native children were poor compared with 1 in 12 white children.
- The youngest children are the poorest. Nearly 1 in 6 children under 6 were poor and almost half lived in extreme poverty below half the poverty line.

INCOME AND WEALTH INEQUALITY: Income and wealth inequality are growing and harming children in low-income, Black and Brown families.

- The share of all wealth held by the top one percent of Americans grew from 30 to 37 percent and the share held by the bottom 90 percent fell from 33 to 23 percent between 1989 and 2019.
- Today, a member of the top 10 percent of income earners makes about 39 times as much as the average earner in the bottom 90 percent.
- In 2019, the median family income of white households with children (\$95,700) was more than double that of Black (\$43,900), and Hispanic households with children (\$52,300).

HOUSING AND HOMELESSNESS: The lack of affordable housing and federal rental assistance leaves millions of children homeless or at risk of homelessness.

- More than 1 in 3 children live in households burdened by housing costs, meaning more than 30 percent of their family income goes toward housing.
- More than 1.5 million children enrolled in public schools experienced homelessness during the 2017-2018 school year.
- 74 percent of unhoused students during the 2017-2018 school year were living temporarily with family or friends.

CHILD HUNGER AND NUTRITION: Millions of children live in food-insecure households, lacking reliable access to safe, sufficient, and nutritious food.

- More than 1 in 7 children—10.7 million—were food insecure, meaning they lived in households where not everyone had enough to eat. Black and Hispanic children were twice as likely to live in food-insecure households as white children.
- The Supplemental Nutrition Assistance Program (SNAP) helped feed 17 million children in Fiscal Year 2018—nearly a quarter of all children in America.
- Half of all families that received SNAP in 2019 were not able to get enough healthy food, however, because SNAP benefits were too low. Among households with children, monthly SNAP benefits averaged just \$118 a person—or less than \$4 a day.

OVERVIEW

CHILD HEALTH: Our children have lost the health coverage they need to survive and thrive at an alarming rate.

- An estimated 4.4 million children under age 19, were uninsured—an increase of 320,000 more children without health insurance since 2018.
- Disparities in health insurance coverage persist. The rates of uninsured children are especially high among Hispanic children, undocumented children, children living in the South, and children in families with lower incomes.
- Medicaid and CHIP are the foundation of the nation's health insurance system for children. In 2019, nearly 36 million children under 19 received comprehensive, pediatric-appropriate and affordable health coverage through Medicaid and CHIP.

EARLY CHILDHOOD: The high cost of child care and lack of early childhood investments leaves many children without quality care during critical years of brain development.

- Center-based child care for an infant cost more than public college tuition in 28 states and the District of Columbia in 2019. More than 80 percent of two-child families were paying more for child care than for rent.
- During the 2018-2019 school year, only 34 percent of 4-year-olds and 6 percent of 3-year-olds were enrolled in a state-funded preschool program.

EDUCATION: America's schools continue to slip backwards into patterns of deep racial and socioeconomic segregation, perpetuating achievement gaps.

- During the 2017-2018 school year, 19 percent of Black, 21 percent of Hispanic, and more than 26 percent of American Indian/Alaska Native public school students did not graduate on time compared with only 11 percent of white students.
- More than 77 percent of Hispanic and more than 79 percent of Black fourth and eighth grade public school students were not proficient in reading or math in 2019, compared with less than 60 percent of white students.
- In 2017, 60 percent of Black children attended high-poverty schools with a high share of students of color while fewer than 9 percent of white children did.

CHILD WELFARE: For the first time since 2012, the number of children in the child welfare system fell, but too many children wind up in foster care because of poverty.

- Black and American Indian/Alaska Native families are disproportionately impacted by the child welfare system. Nationally, Black and Al/AN children are represented in foster care at a rate 1.66 and 2.84 times their portion of the overall population, respectively.
- After steadily declining since 2008, the number of children aging out of the foster care system jumped by more than 14 percent in 2019, with 20,445 youth reaching adulthood without a permanent family.

YOUTH JUSTICE: A disproportionate number of children of color are incarcerated in the juvenile justice and/or adult criminal justice systems, placing them at risk of physical and psychological harm.

- Despite a 67 percent reduction in child arrests between 2009 and 2019, 530,581 children were arrested in the U.S and a child or teen was arrested every 59 seconds.
- Black children were 2.4 times more likely to be arrested and American Indian children were 1.5 times more likely to be arrested than white children.

OVERVIEW

• Black youth represented less than 15 percent of the total youth population but 52 percent of youth prosecuted in adult criminal court in 2018. Black youth are nine times more likely than white youth to receive an adult prison sentence, American Indian/Alaska Native youth are almost two times more likely, and Hispanic youth are 40 percent more likely.

GUN VIOLENCE: Child and teen gun deaths hit a 19-year high in 2017 and have remained elevated since.

- Gun violence was the leading cause of death for children and teens ages 1-19 in 2018, surpassing motor vehicle accidents for the first time.
- In 2019, 3,371 children and teens were killed with guns—one every 2 hours and 36 minutes.
- Black children and teens had the highest gun death rate, followed by American Indian/Alaska Native children and teens. Black children and teens were 4 times more likely to die from gun violence than their white peers.
- The United States has more guns than people—and nearly 1 in 5 are sold without background checks.

IMMIGRANT CHILDREN: Family separation and anti-immigrant policies are dangerous to children's health, development, and well-being.

- Nearly 1 in 4, approximately 18 million, U.S. children lived with at least one immigrant parent in 2018.
- More than 1 in 4 immigrant children did not have health coverage in 2019, 25.5 percent compared to 5.1 percent of native-born citizen children.
- An estimated 6.9 million children lived with undocumented parents. Chronic uncertainty and distress about the threat of enforcement activity destroy children's sense of safety and their mental health.

Each Day in America

- 2 mothers die from complications of childbirth.
- 5 children are killed by abuse or neglect.
- 8 children or teens die by suicide.
- 9 children or teens are killed with a gun.
- 20 children or teens die from accidents.
- **46** children or teens are injured with a gun.
- **59** babies die before their first birthday.
- 121 children are arrested for violent crimes.
- children are arrested for drug crimes.
- **514** public school students are corporally punished.*
- 678 babies are born without health insurance.
- 827 babies are born into extreme poverty.
- **860** babies are born with low birthweight.
- 1,541 babies are born into poverty.
- 1,785 children are confirmed as abused or neglected.
- **1,909** children are arrested.
- 2,906 high school students drop out.*
- 14,206 public school students are suspended.*

*Based on 180 school days a year

CHILD POPULATION

CHILDREN IN AMERICA.

2020 THE YEAR CHILDREN OF COLOR BECAME THE MAJORITY OF

n 2019, there were over 73 million children in the United States—making up 22 percent of our nation's population.¹

The U.S.—and especially our youngest generation—is reaching a critical moment in racial and ethnic diversity. We need policies and programs that recognize and celebrate this growing diversity.

- In 2019, children of color made up 49.8 percent of all children.
- More than half of the 19.6 million children under five in America in 2019 were children of color.²
- The majority of children under 18 were children of color in 14 states—Alaska, Arizona, California, Delaware, Florida, Georgia, Hawaii, Maryland, Mississippi, Nevada, New Jersey, New Mexico, New York and Texas— and the District of Columbia (see **Table 1**).
- In 2019, 36.7 million children were white (50.2 percent); 18.7 million were Hispanic (25.6 percent); 10 million were Black (13.7 percent); 3.7 million were Asian (5.0 percent); 615,950 were American Indian/Alaska Native (<1 percent); and 147,057 were Native Hawaiian/Other Pacific Islander (<1 percent).³
- Previous estimates suggest the majority of all U.S. children are children of color as of 2020 and the U.S. population will continue to become more racially and ethnically diverse.⁴

The U.S. is also graying and approaching a tipping point in age, with older adults set to outnumber children.

- While the proportion of the population that is younger than 18 has been gradually decreasing (from 24.0 percent in 2010 and 22.3 percent in 2019), the proportion of the population that is 65 or older continues to steadily increase (from 13.1 percent in 2010 and 16.5 percent in 2019).⁵
- Given current trends, it is expected that the share of seniors will continue to grow and there will be more seniors than children by 2040.⁶
- We must prepare our nation to support its aging population, but also plan ahead to ensure our increasingly diverse child population is set from birth on a path to a productive and successful future with the foundation necessary to support future generations.

Our current federal spending reflects our nation's skewed priorities: Our children are our future but are not getting the investments they need to thrive.

- Despite children making up such a large portion of our population, less than 7.5 percent of federal spending went towards children in FY2020.⁷
- Although Congress raised statutory caps on discretionary spending in FY2018-FY2020, children didn't receive their fair share of those increases and children's share of total federal spending has continued to decline between FY2016 and FY2020.⁸

CHILD POPULATION

CHILD POVERTY

71%

OF CHILDREN IN POVERTY ARE CHILDREN OF COLOR

The COVID-19 pandemic has not only disrupted the everyday lives of our children, it has also exacerbated our nation's greatest moral disgrace: child poverty. Even before the pandemic, children, particularly children of color and very young children, were the poorest Americans. More than 10 million children—nearly 1 in 7 (14.4 percent)—lived in poverty in 2019, the most recent year for which U.S. Census Poverty Data are available.¹ The child poverty rate is one-and-a-half times higher than that for adults ages 18-64 (9.4 percent) and adults 65 and older (8.9 percent) (see **Table 2**). In 2019, a family of four was considered poor if their annual income fell below \$26,172, which amounts to \$2,181 a month, \$503 a week, or less than \$72 a day (see **Table 3**). Almost half of all children living in poverty lived in extreme poverty, which is defined as half the poverty threshold or an annual income of \$13,086 for a family of four.

Historical, systemic racism and institutional barriers mean that children of color have been particularly vulnerable to child poverty. Black and Hispanic children experience some of the highest poverty rates in the country, and 71 percent of children in poverty in 2019 were children of color.

- Nearly 1 in 5 children of color in America (20.5 percent) were poor. Children of color were 2.5 times more likely to be poor than their white, non-Hispanic peers.²
- 3.6 million children under six were living in poverty in 2019. Nearly 1 in 6 infants, toddlers, and preschoolers ages 0-5 were poor (15.4 percent).³
- More than 1 in 4 Black children (26.5 percent) and 1 in 5 Hispanic children (20.8 percent) and American Indian/Alaska Native children (20.6 percent) were poor, compared with 1 in 12 white, non-Hispanic children (8.3 percent) and 1 in 14 Asian, Native Hawaiian, and other Pacific Islander children (7.7 percent) (see Tables 4-5).⁴

Our youngest Americans are being hit hardest during their years of greatest development.

• Nearly 1 in 6 children under six were poor in 2019 and almost half of them lived in extreme poverty (see **Table 6**).

Children's chances of being poor are also a result of the lottery of geography—with some states and regions having higher rates of poverty and inequality than others—as well as dramatic differences in services and support for children in families with low-incomes.

- More than 25 percent of Black children were poor in 39 states and the District of Columbia in 2019; Hispanic children, in 22 states; and American Indian/Alaska Native children, in 24 states.
- No states had white child poverty rates 20 percent or higher (see Table 6).
- Black children are more likely than white children to live in states where benefits from Temporary Assistance for Needy Families (TANF), the nation's core cash assistance program, are lowest.⁵ Statelevel decisions about benefit allocation and amounts are too often rooted in historical racism and have disparate impacts on Black families.⁶

This pandemic has exposed how unequal our pre-COVID economy was: families were working to take care of their children, but the unjust and unequal economy built by our political leaders was not working for them and left millions of children behind. More than two-thirds of poor children (70.1 percent) had at least one family member who worked in 2019, and more than one-third (33.7 percent) had at least one family more who worked full-time year-round.

CHILD POVERTY

We know what works when children and families are in financial crisis.⁷ Mountains of evidence show the benefit of government assistance programs,⁸ which help curb the negative effects poverty has on children, families, and the economy. Investing in children and their healthy development not only helps our economy, but helps reduce racial disparities and improve opportunities for children in the long run.

• In 2019, more than four million children were lifted out of poverty with the help of the Child Tax Credit (CTC) and Earned Income Tax Credit (EITC); more than 1.4 million with Social Security; nearly 1 million with Supplemental Nutrition Assistance Program (SNAP); 763,000 with housing subsidies; 661,000 with the National School Lunch Program; 536,000 with the Supplemental Social Insurance (SSI); 160,000 with Temporary Assistance for Needy Families (TANF) and general assistance; 133,00 with Unemployment Insurance and 127,000 with the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC).9

Child poverty and racial disparities will worsen if we do not continue to ensure relief for families and expand basic needs programs to help all children learn, grow, and thrive during this pandemic and beyond. Cash assistance, child allowances, rental and housing support, SNAP, and unemployment insurance are all relief measures that must be boosted in the short and long term to help families.

COVID-19 and the Need for Real-Time Data and Updated Measures of Poverty

Each September, the U.S. Census Bureau releases income, poverty, and health insurance statistics from the prior year. The official poverty estimates and poverty thresholds released by the Census Bureau inform important policy choices, yet they fail to fully and meaningfully capture who is experiencing poverty and what a family requires to survive and thrive in the 21st century economy. Additionally, as economic conditions have changed dramatically this year, the available data inadequately depicts the challenges that children and families are experiencing due to the impacts of COVID-19. Official Census Bureau measures of poverty are based on a family's annual resources, which means this data is not only outdated, but creates a lag that makes it hard to spot trends in poverty or measure the impact of policy responses in real time.

However, an October 2020 data analysis by the Center on Poverty & Social Policy (CPSP) at Columbia University monitored monthly poverty estimates, which showed that an additional eight million Americans—including 2.5 million children—have fallen into poverty since May 2020.¹⁰ The findings revealed that poverty rose beyond pre-COVID levels after Congress allowed COVID relief to expire. Although the stimulus checks and expanded unemployment benefits included in the CARES Act initially prevented a rise in poverty, keeping as many as 18 million Americans out of poverty in April and May of 2020, CPSP found much of this progress was reversed throughout the summer after cash assistance ended in June and the \$600 weekly extra unemployment benefits expired in July.¹¹ By September 2020, the poverty reduction impact of the relief legislation had fallen dramatically and poverty rates had risen among all groups, according to Columbia's analysis.¹² Columbia's work underscores the importance of frequently updated data to inform wise policy choices, and a forthcoming February 2021 report will update the monthly poverty estimates at a crucial time when a new Congress and administration will be in place.

Advocates and policymakers need consistent, non-partisan, evidence-based, statistically and economically relevant and timely data on child poverty and family income to better respond to this economic crisis and protect children and families from harm.

INCOME AND WEALTH INEQUALITY

IN 2019 THE MEDIAN WHITE FAMILY HAD ALMOST EIGHTTIMES MORE WEALTH THAN THE MEDIAN BLACK FAMILY AND FIVE TIMES MORE THAN THE MEDIAN HISPANIC FAMILY.

A family's income is critical to ensuring basic needs are met for a child's life. Income, which is the revenue a family receives, either from work or return on investment, helps a family put food on the table and keep a roof over their heads. Income inequality is the extent to which income is concentrated among the wealthiest few rather than shared equally among all earners. In the U.S., our economic rules have favored the rich at the expense of our communities' well-being, especially communities of color. People are working harder than ever, but a powerful and wealthy few CEOs, corporations, and billionaires reap the benefits, raking in record profits off lower-income workers' production while their families struggle to get by.

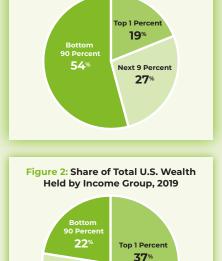

On the surface, data tells a rosy story about incomes in America; median household income grew by 4.5 percent between 2018 and 2019 to \$65,712, the highest level in history.¹ But in recent decades, incomes have grown very quickly for the rich, and relatively slowly for everyone else. Since 1979, incomes for the top 1 percent of earners have grown by 261 percent, compared with only 49 percent for the middle 60 percent of earners.² These unequal growth rates have produced some astonishing present-day income disparities:

- The top 20 percent of households earn, on average, about 14 times more than households in the bottom 20 percent.³ In 1975, the average household income of the top 20 percent of Americans was 10 times that of the bottom 20 percent.⁴
- A member of the top 10 percent of income earners makes about 39 times as much as the average earner in the bottom 90 percent; the average member of the richest 0.1 percent of the population earns about 196 times more than an average earner in the bottom 90 percent.⁵
- In 2019, the share of total income going to the top 10 percent was almost 50 percent and the share going to the top 1 percent was 19 percent (see Figure 1).⁶

In short, incomes have exploded for the rich, while creeping up slowly for the vast majority of earners, a fact that has corrosive effects on the American Dream. Slow-growing family income means that economic mobility is on the decline and children born into low-income families may grow up to make less money than their parents.⁷

Income inequality contributes to another runaway economic problem: wealth inequality. Wealth or net worth refers to the total value of a person or family's money, property, and other assets minus any debt they hold; wealth inequality is the disproportionate concentration of wealth among the richest few. Like income inequality, wealth inequality has increased for decades and reached levels not seen for almost a century. Today, wealth is even more concentrated than income.⁸

In 2019, compared to 1989, the share of wealth held by the top one percent of Americans grew from 30 to 37 percent of all wealth and the share held by the bottom 90 percent fell from 33 to 23 percent.⁹
 The top 10 percent of Americans owned more than 75 percent of all wealth in 2019 (see Figure 2).¹⁰

Next 9 Percent

39%

Figure 1: Share of Total U.S. Income

Held by Income Group, 2019

In total, the richest five percent own more than two-thirds of the country's wealth. The richest one
percent own more than half of the stock owned by private Americans, but hold just five percent of the
same group's debt.¹¹

 In 2018, the three richest men in the United States—Jeff Bezos, Bill Gates and Warren Buffet—held as much wealth as the entire bottom half of Americans.¹²

This is not by chance. For centuries, our nation's policies have been intentionally constructed in a way that has disproportionately denied families with low incomes, especially families of color, the opportunity to build wealth. Racist housing policies, for example, led to differences in homeownership rates that today account for nearly one-third of the racial wealth gap.¹³ As a result of such policies, racial income and wealth inequality in our nation is staggering. For example:

- In 2019, the median income of Black (\$43,900), Hispanic (\$52,300), and American Indian (\$48,000) families with children was about half the median income of white families with children (\$95,700) (see **Table 7**).
- For every \$1 earned by the median white household in 2019, the median Black household only earned 61 cents and the median Hispanic household, 74 cents.¹⁴
- In 2019, the median net worth of white families (\$188,200) was almost eight times more than Black families (\$24,100) and five times more than Hispanic families (\$36,100).¹⁵
- Today's median Black family owns \$3,600—just 2 percent of the median white family's wealth. The median Latino family owns \$6,600—only 4 percent of that of the median white family.¹⁶
- The 400 richest people in the U.S. hold more wealth than every Black household plus a quarter of Hispanic households combined.¹⁷

Inequality is a global phenomenon, but the U.S. does not fare well even when compared with other industrialized countries. In 2019, the U.S. held the largest share of the world's wealth (nearly 30 percent).¹⁸ Studies suggest, however, that the U.S. has the highest level of wealth inequality and one of the highest levels of income inequality among developed countries.¹⁹

COVID-19 Made the Rich Even Richer and Widened Inequality

As the COVID-19 pandemic raged and millions of families lost jobs, a familiar pattern accelerated: the rich got richer, while everyone else suffered.

The pandemic, and the corresponding economic recession, hit low-income workers hardest with lost jobs, wages, and livelihoods. Low-income workers experienced the highest job loss rate during the pandemic, but comparatively few of the highest-income workers lost their jobs.²⁰ In all, more than ten percent of workers between the ages of 25 and 54 lost their jobs during the pandemic.²¹ Over half of families with children experienced a job loss or loss of income during the pandemic, with those losses concentrated at the lower-end of the income distribution.²²

While low-income workers were laid off at staggering rates, the wealthiest few saw their fortunes expand dramatically. According to an Institute for Policy Studies analysis, the combined wealth of all U.S. billionaires increased by more than \$1 trillion between March and December 2020, from approximately \$3 trillion to about \$4 trillion.²³ Elon Musk's net worth increased by about \$100 billion during the pandemic.²⁴ Jeff Bezos's fortune grew by about \$70 trillion.²⁵ Although the stock market, took an initial hit in the spring, it has since recovered and remains near an all-time high.

Racial inequality has continued to widen during the pandemic as well. Black, Hispanic, and Indigenous communities were more likely to get sick and die from COVID-19 in addition to having greater chances of becoming unemployed during the pandemic, despite being overrepresented among "essential workers."²⁶ As the economic recovery progressed, job and income losses for white people bounced back much more quickly than for Black or Hispanic people.²⁷

HOUSING AND HOMELESSNESS

MORE THAN

1.5 MILLION

CHILDREN ENROLLED IN PUBLIC SCHOOLS EXPERIENCED HOMELESSNESS DURING THE 2017-2018 SCHOOL YEAR.

aving a safe, stable home is a basic need for all children. Homelessness, unstable housing, and the unavailability of affordable housing have dire consequences for children's health, education, and future earning potential. Yet, the right to a decent, safe, and affordable home was out of reach even before the COVID-19 crisis for far too many children and families—but particularly for Black, Hispanic, and Indigenous families. Access to housing is a racial justice issue as families of color, especially Black families, are more likely to experience eviction, homelessness, and segregated housing and neighborhoods due to racist policies built deep into our housing system.

The affordable housing crisis has deep and racist roots, but stems largely from policymakers' intentional divestment from affordable housing and rental assistance programs.

- Federal investment in housing was gutted in the 1970s and 80s and the number of unhoused children and families skyrocketed. The crisis deepened after the 2008 financial crisis as foreclosures forced 9 million new families into the rental market.¹
- As more families sought affordable and safe rental housing, construction failed to keep pace with growing demand, and the new units built were mostly luxury units in big cities. Rents rose and working-class wages remained stagnant, leaving many families unable to find suitable housing.²
- By 2020, rents were so high that a person working full-time, year-round at minimum wage could not afford the monthly Fair Market Rent for a two-bedroom rental unit in any state or the District of Columbia and still have enough money for food, utilities, and other necessities.³ To afford this rent, a single person working full-time would have to make almost \$24 an hour, more than three times the federal minimum wage (see **Table 8**).⁴

These barriers to prosperity and disinvestment in federal housing programs have put decent, affordable housing out of reach for millions of people and disproportionately impacted Black, Hispanic, and Indigenous communities. Families with children are hit especially hard by the affordable housing crisis.

- More than 1 in 3 children live in households burdened by housing costs, meaning more than 30 percent of their family income goes toward housing.⁵ Sixty-one percent of children in low-income households are rent-burdened.⁶
- Nearly 2.6 million families with children experience "worst-case housing needs," meaning they are extremely rent-burdened, their income is at or below the poverty line, they spend half of their income on housing, and receive no housing assistance from the government.⁷
- Twenty percent of Black households, 17 percent of American Indian or Alaska Native households, 15 percent of Hispanic households, and 10 percent of Asian households (compared to just six percent of white households), are extremely low-income renters and are often locked out of affordable housing due to systemic and structural racism and decades of racist policies.⁸

The affordable housing crisis is the primary reason so many families are unhoused. Children made up 107,069—nearly 1 in 5—of the nearly 568,000 people who were unhoused on a single night in January 2019.⁹

- Thirty percent of people who were unhoused were in families with children, and half of all families who are unhoused with children lived in just three states: California, Massachusetts, and New York. Family homelessness declined by 5 percent between 2018 and 2019 and by 27 percent between 2007 and 2019.¹⁰
- In 2019, more than half of individuals in families who were unhoused were Black.¹¹ Black youth are 83 percent more likely than youth of other races to be unhoused.¹²
- More than 1.3 million children under six were unhoused in 2017.¹³

More than 1.5 million unhoused children were enrolled in public schools during the 2017-2018 school year, according to the Department of Education, excluding younger children and youth not enrolled in school (see **Table 9**).¹⁴

- The number of unhoused students has increased by 15 percent since the 2015-2016 school year.¹⁵
- Seventy-four percent of unhoused students during the 2017-2018 school year were living temporarily with family or friends; 12 percent were in shelters or transitional housing; 7 percent were in hotels or motels; and 7 percent were unsheltered, often living in abandoned buildings or cars.¹⁶
- Access to school for unhoused children is complicated by economic mobility and the lack of school supplies and clothes, funds for transportation, and necessary records to enroll in a new school. The trauma, poor physical and mental health, hunger, and fatigue many experience continue to challenge these children when they get to school.
- In addition to school-aged public school students, 4.2 million teens and young adults experienced homelessness during 2016 and 2017.¹⁷ Black and Hispanic youth, youth living in poverty, and young adults; youth with less than a high school diploma or GED; young parents; youth aging out of foster care; and LGBTQ youth were all at especially high risk of homelessness.

Housing insecurity and homelessness are exacerbated by a lack of accessible federal assistance. This assistance is extremely effective, but these programs do not come close to meeting families' needs because they are woefully underfunded.

- Families with children make up 60 percent of those helped by federal rental assistance.
- Although federal rental assistance can help reduce homelessness, housing instability, and overcrowding, only 1 in 4 eligible households receive it.¹⁸
- Housing vouchers can help families move from areas of concentrated poverty to lower-poverty neighborhoods. Children who moved from concentrated poverty neighborhoods before age 13 have been shown to have higher earnings as 26-year-old adults when compared with those who did not leave the neighborhoods.¹⁹
- Vouchers for unhoused families with children reduce foster care placements by more than half and also reduce school moves and other hardships.²⁰

COVID-19 Has Pushed Millions of Children and Families to the Brink of Eviction

The pandemic has accelerated the nationwide affordable housing crisis and the racial inequities in housing. By February 2021, the hardship facing renter families with children was staggering. More than a quarter of renter families with children were behind on their rent.²¹ In February, nearly 4 in 10 of those families reported little or no confidence in their ability to pay the next month's rent.²² Most shocking of all, almost half of renter families with children said it was either somewhat or very likely that they would lose their home within the next two months due to eviction.²³

Though evictions were banned in many states and localities for much of 2020 and banned nationwide beginning in September by the Centers for Disease Control and Prevention (CDC), many evictions slipped through the patchwork of legal protections and became a major driver of the spread of COVID-19. Evictions that took place between the beginning of the pandemic and the CDC's national eviction moratorium in September led to 433,700 excess COVID-19 cases and 10,700 additional deaths.²⁴

If the CDC's eviction moratorium is allowed to expire before renters receive adequate assistance from Congress, 30 to 40 million renters are at risk of losing their home due to eviction.²⁵ The fallout from such a wave of evictions would be devastating, a crisis primed by the nation's failure to address its underlying affordable housing crisis.

Ð

CHILD HUNGER AND NUTRITION

MORE THAN

CHILDREN LIVED IN FOOD-INSECURE HOUSEHOLDS BEFORE THE COVID-19 PANDEMIC.

Children need healthy food to grow, learn, and thrive. Even before the COVID-19 pandemic, however, children in America went hungry at alarming rates. Institutional racism, low wages, and other inequities made it impossible for many families—especially Black, Hispanic, and Indigenous families—to put food on the table. At the same time, policymakers have refused to adequately fund nutrition programs to reach and feed all children in need. Millions of children entered this crisis without consistent access to nutritious food, leaving them especially vulnerable to hunger and harm.

In 2019, more than 1 in 7 children—10.7 million—were food insecure, meaning they lived in households where not everyone had enough to eat (see **Table 10**). These households struggled to afford and access healthy meals, forcing them to rely on low-cost food to feed their children, skip meals, or even go hungry.

- Black and Hispanic children were twice as likely to live in food-insecure households as white children. Nearly 1 in 4 Black children (24.1 percent) and 1 in 5 Hispanic children (19.2 percent) lived in households that didn't get enough food to eat in 2019, compared with 1 in 9 white children (11.0 percent).¹
- Younger children also faced a greater risk of hunger. Households with children under 6 were more likely to lack access to healthy food than households with children under 18.²
- The majority of households experiencing hunger struggle to put food on the table even with full- or part-time employment. In 2019, 61 percent of households experiencing hunger were in the labor force;
 51 percent had at least one full-time worker.³ With living expenses rising, wages stagnating, and systemic racism, food and other basic necessities are becoming increasingly out of reach for working families.
- Lack of nutritious and healthy food is linked to low birth weight and birth defects, physical and mental health problems, oral health problems, and poor educational outcomes.⁴

School meal programs like the National School Lunch Program (NLSP) and the National School Breakfast Program (SBP) are a critical source of nutritious food for children experiencing hunger and poverty. Many children typically consume up to two full meals a day at school and too often, these are the only meals they can count on.

- Nearly half of all public school students rely on free or reduced-price school meals to meet their daily nutritional needs.⁵ During the 2018-2019 school year, more than 21.6 million children received free or reduced-price school lunch, and 12.4 million received free or reduced-price breakfast (see **Table 11**).
- While most schools are now serving free meals to all children regardless of income in response to COVID-19, a growing number offered universal meals through the Community Eligibility Provision (CEP) prior to the pandemic. During the 2019-2020 school year, nearly 30,700 schools serving 14.9 million children participated in community eligibility,⁶ allowing them to offer free meals to every student without processing applications or collecting meal fees. This is up from nearly 28,800 schools that participated during the previous school year. Serving meals to all students at no charge reduces administrative burdens and costs, enabling schools to invest time and resources in building stronger nutrition programs that reach more children.

Even during traditional school years, however, most children who receive free or reduced-price school meals cannot access them when schools are closed after school, on weekends, and over the summer. Prolonged school closures due to COVID-19 are now exacerbating the systemic gaps in federal nutrition support, leaving children without reliable access to healthy meals year round.

CHILD HUNGER AND NUTRITION

- Only 1 in 15 eligible children received after school suppers through the At-Risk Afterschool Meals component of the Child and Adult Care Food Program (CACFP) on an average weekday in October 2019.⁷
- In summer 2019, the Summer Food Service Program (SFSP) and the Seamless Summer Option (SSO) through the NSLP reached only 1 in 7 children (13 percent) who received free or reduced-price lunch during the 2018-2019 school year (see **Table 11**). This marks the fourth year in a row that participation in summer nutrition programs declined.

The Supplemental Nutrition Assistance Program (SNAP)—our nation's largest federal nutrition program helps connect children to healthy meals to supplement food budgets, improve health, and reduce poverty. Due to limited funding, however, SNAP benefits fall far short of meeting the need—and that need has only grown since the pandemic began.

- The Supplemental Nutrition Assistance Program (SNAP) helped feed 17 million children in Fiscal Year 2018—nearly a quarter of all children in America (see **Table 12**). SNAP participation is linked to improved health and educational outcomes .⁸
- SNAP lifted nearly one million children out of poverty in 2019 and helps more children escape deep poverty than any other government program.⁹
- In FY2018, 3.8 million households had no income except SNAP benefits, including 1.2 million households with children.¹⁰
- Half of all families that received SNAP in 2019 were not able to get enough healthy food,¹¹ however, because SNAP benefits were too low. Among households with children, monthly SNAP benefits averaged just \$118 a person—or less than \$4 a day.¹²

Federal nutrition programs like SNAP must be strengthened and expanded to support children's well-being and success.

- Calculating SNAP benefits using the Low Cost Food Plan rather than the current Thrifty Food Plan would increase SNAP benefits by 31 percent, improve SNAP's anti-hunger impact, and lift 1.5 million children out of poverty.¹³
- Boosting SNAP is smart economic policy, especially during recessions. Every \$1 invested in SNAP generates \$1.50 to \$1.80 in economic activity and creates jobs.¹⁴

COVID-19 is Deepening America's Longstanding Hunger Crisis

Child hunger was a crisis long before the COVID-19 pandemic—and it has only worsened since. Widespread school and child care closures have left millions of children without reliable access to affordable meals, while record job losses have made it even harder for families to keep food on the table at home. Now, child hunger is reaching dangerous new heights. As of February 2021, more than 1 in 7 adults with children (14.5 percent) reported that their children were not getting enough to eat¹⁵—more than five times the pre-pandemic rate (3 percent).¹⁶

Due to historic and systemic racism, children of color are going hungry at even higher rates. As of February 2021, more than 1 in 5 Black and Hispanic adults with children (22.8 percent and 20.6 percent, respectively) said their households were not getting enough to eat compared with 1 in 10 white adults with children (10.4 percent).¹⁷ If unemployment and poverty rates remain elevated, as many as 1 in 4 children—18 million in total—could be at risk of going hungry as a result of COVID-19.¹⁸ Without continued and expanded nutrition assistance during the pandemic and beyond, rising child hunger will devastate our children's development and community success for years to come.

2

CHILD HEALTH

726,000

CHILDREN LOST HEALTH INSURANCE BETWEEN 2016 AND 2019.

All children need access to comprehensive, affordable health coverage that is easy to get and to keep. Yet, even before our country began facing a devastating pandemic that has left more than 28 million Americans infected with the coronavirus, including more than 3 million children, our children were losing access to the health coverage they need to survive and thrive at an alarming rate.¹

Decades of hard-fought progress to expand access to comprehensive, affordable health and mental health coverage through expansions of Medicaid, the Children's Health Insurance Program (CHIP), and the Affordable Care Act brought the rate of uninsured children in America to an historic low. However, over the course of the last three years, our nation has shamefully reversed course and the number of uninsured children in America continues to steadily *increase*.²

- In 2019, an estimated 5.7 percent of children under age 19 (nearly 4.4 million) were uninsured—an increase of 320,000 more children without health insurance since 2018 (see **Table 13**). This is the third year in a row the number of uninsured children has grown and it is the largest annual increase in more than a decade.³
- This data also highlights continued and worsening disparities in health insurance coverage. The rates of uninsured children were especially high among Hispanic children, undocumented children, children living in the South, and children in families with lower incomes; and these children were among those that experienced some of the greatest increases in uninsured rates between 2018 and 2019.⁴
- This means millions of children and families lacked health insurance even before the rapid spread of the COVID-19 pandemic and the beginning of the economic crisis where many parents became unemployed and lost access to job-based health insurance. While fortunately, some of these children may be eligible for Medicaid and CHIP, it is but certain that many of them are going uninsured.⁵ In 2018, more than half (57.4 percent) of uninsured children were eligible for Medicaid or CHIP, demonstrating the critical need for outreach and enrollment efforts.⁶

Unfortunately, this is far from surprising given sustained efforts over the last four years by the Trump administration to undermine the public health insurance system, including Medicaid and CHIP, which form the backbone of the health insurance system for children in low- to middle-income families, as well as the administration's anti-immigrant rhetoric and policies which have led many families to remove their eligible children—many of them U.S. citizens—from the health coverage they need out of fear of repercussions.⁷

- In 2019, Medicaid and CHIP provided comprehensive, pediatric-appropriate and affordable health coverage to more than 36 million children under 19 (see **Table 14**).
- More than half of American Indian/Alaska Native, Black, multi-racial, and Hispanic children rely on Medicaid and CHIP as their source of health coverage.⁸
- Following steady increases in child enrollment in Medicaid and CHIP since 2007, 2017 was the first year to not see an increase despite a strong economy—and those numbers have only gotten worse in subsequent years. Child enrollment in Medicaid and CHIP decreased by 821,000 between 2017 and 2018 and decreased by 224,000 between 2018 and 2019.⁹
- Children in low-income families are far more likely to be covered by Medicaid and CHIP than private insurance. In 2019, 72 percent of children in low-income families had public health insurance coverage, including Medicaid, CHIP, Medicare, and TRI-CARE.¹⁰
- These health insurance programs provide lifelong benefits that far outweigh the short-term costs. The National Bureau of Economic Research compared children eligible for Medicaid during childhood with those not eligible and found Medicaid-eligible children were more likely to attend college and make greater contributions as adult taxpayers.¹¹

CHILD HEALTH

We know that children with health coverage are more likely to receive the preventive services they need, including immunizations; miss fewer days of school and have better educational outcomes; and grow up to be more economically secure and more likely to contribute to their communities.¹² As children are losing coverage at staggering rates, there will be long-term consequences for their health and well-being.

When parents have health coverage, their children are more likely to have health coverage.

- A child is eight times more likely to have public health insurance if their parent has it.¹³
- States that have expanded Medicaid coverage to parents have higher Medicaid participation among children. For example, Massachusetts' coverage expansion for parents cut the rate of uninsured children in half.¹⁴
- While 33 states and the District of Columbia have expanded Medicaid to very low-income parents and adults under the ACA's expansion option, 12 states have not done so as of October 2020 (see **Table 15**).
- States that have not expanded Medicaid to parents and other adults under the Affordable Care Act have seen increases in their rate of uninsured children nearly three times as large as states that have.¹⁵
- Lack of health coverage—as well as inequities in our healthcare system and disparities in social determinants of health—have devastating impacts on our nation's infants and mothers.¹⁶ The maternal mortality rate is higher now than it was decades ago, and Black women are bearing the brunt of this crisis.¹⁷ What's more, for every 1,000 infants born in 2018, six died before their first birthday (see **Table 16**). Continuing to expand coverage to low-income parents through the ACA's Medicaid expansion would help decrease the number of uninsured children as well as ensure more women access to essential prenatal care to help reduce both maternal and infant mortality.¹⁸

Children Are Not Immune

Although COVID-19 infection and death rates may be lower for children when compared to adults, our children are certainly not immune—to the virus itself or the racial inequities it is magnifying.

- As of February 25, 2021, 3,168,274 total child COVID-19 cases have been reported, representing 13.1 percent of all cases. Children were 0 to 0.19 percent of all COVID-19 deaths in the states that provided data (Note: only 43 states provided data on the age distribution of COVID-19 deaths).¹⁹
- CDC reports show that between February and July 2020, 78 percent of children who died from COVID-19 were Hispanic, Black, and American Indian children, though they represent only 41 percent of the population.²⁰

These disparities mirror the disparities we see among adults and reflect decades of structural racism and injustice that have created a long history of social and economic inequities.²¹ Long before COVID-19, children of color were more likely to experience harmful environmental factors and toxic stress, grow up with underlying health conditions, and experience inequitable health care into adulthood including racial bias, discrimination, and inadequate treatment.²² Amid the pandemic, children of color are more likely to live with essential workers; experience crowded housing conditions, food insecurity, and wealth gaps; and face additional barriers to accessing high-quality, non-discriminatory health care—inequities that put the health and well-being of Black, Hispanic, and American Indian children at risk during a public health crisis.²³

In addition to COVID-19 cases, the pandemic has created further child health concerns as well. Children are missing routine well-child visits that include important developmental screenings and vaccinations: compared to March through May 2019, there have been 3.2 million fewer child screening services, 6.9 million fewer outpatient mental health services, and 1.7 million fewer vaccinations for children ages zero to two through Medicaid and CHIP.²⁴ Even with the need to continue to social distance and limit potential exposure, ensuring children have access to preventative services is critical in order to prevent further health concerns. Vaccines save lives and are critical in order to keep children safe from preventable diseases and ensure against the added crisis of a preventable outbreak amid the ongoing pandemic.

25

EARLY CHILDHOOD

IN 2019, CENTER-BASED CHILD CARE FOR AN INFANT COST MORE THAN PUBLIC COLLEGE TUITION IN **28 STATES AND DC.**

The first five years of a child's life are a time of both great opportunity and risk as their brain develops more rapidly than at any other point. Children who grow up in supportive environments are more likely to develop self-confidence, an increased desire to learn, and better impulse control as well as improved achievement in school and throughout their life.¹ Unfortunately, COVID-19 has upended a system that was already not adequately serving children and families: even before the pandemic, children—especially the 3.6 million children under six living in poverty—lacked access to a meaningful continuum of care and supports during this critical period of development.²

A full continuum of high-quality early childhood development and learning opportunities from birth to age five have been proven to buffer the negative impacts of poverty and other stressors, improve outcomes throughout a child's life, and yield great societal returns on investment.

- Head Start and Early Head Start are federally-funded, high-quality early childhood programs that provide comprehensive services including child care, mental health, nutritional, and other developmental services and connect poor children and families with other community resources when needed. Children who participate in the Head Start program are able to pay better attention in school and engage in learning; perform better in cognitive and language development; and have better pre-reading, pre-writing, and vocabulary skills making them more prepared for kindergarten and school.³ The Maternal, Infant, and Early Childhood Home Visiting (MIECHV) Program similarly promotes child development and school readiness.⁴ Gaps in opportunity and outcomes based on race and income exist from the start of school, but access to high-quality early childhood programs can give children the skills they need to thrive in school and close these gaps.⁵
- Studies show children who attend high-quality early childhood programs are more likely to graduate from high school and hold a job, make more money, and are less likely to have contact with the criminal justice system than peers who do not. Programs that directly target children's health outcomes, like Head Start, have been shown to increase child health insurance, child immunization, and receipt of primary care.⁶
- Research estimates the lifelong return on investment for quality early childhood programs is more than 13 percent a year for every dollar invested.⁷

High-quality, affordable child care that meets children's developmental needs is a critical part of the early childhood continuum and essential for working families, but the cost of high-quality child care is a barrier for many.

- Center-based child care for an infant cost more than public college tuition in 28 states and the District
 of Columbia in 2019 (see Table 17). In one study, more than 80 percent of two-child families were paying
 more for child care than for rent.⁸
- The Child Care and Development Fund, which provides subsidies to help families with child care costs, served just 15 percent of all federally-eligible children in 2016.9
- The number of children receiving publicly-funded child care subsidies has decreased by more than 430,000 since 2006 (see **Table 18**). Access to high-quality child care is not guaranteed even for families who do receive subsidies as care costs increase.¹⁰
- A well-trained, competitively-compensated workforce is necessary to ensure the child care provided is high-quality and our children are supported during their most critical years of development. However, in 2019, child care workers in 42 states were paid less than half of a living wage for a single parent with one child (see **Table 19**).

While many existing early childhood development and education programs are effective, they often fall far short of serving and supporting all children in need.

EARLY CHILDHOOD

- Voluntary, evidence-based home visiting programs provide impressive short- and long-term gains for children and families who participate. However, in FY2019, the MIECHV Program served only a small portion of parents and children across the country.¹¹
- Due to underfunding, Head Start served less than 57 percent of eligible three and four-year-olds and Early Head Start served less than 8 percent of eligible infants and toddlers in 2019.¹²
- Other quality preschool programs for three and four-year-olds are also a key part of the continuum. Yet, according to the National Institute for Early Education Research (NIEER), during the 2018-2019 school year, only 34 percent of four-year-olds and 6 percent of three-year-olds were enrolled in a state-funded preschool program. Only four states operated a program that met all ten of NIEER's evidence-based quality standards (see **Table 20**).
- While total state funding for preschool increased by 3.6 percent during the 2018-2019 school year, the increase was small compared to high growth years and spending per child was essentially flat after adjusting for inflation.¹³
- Full-day kindergarten boosts students' academic achievement as well as their social and emotional skills. Studies show full-day kindergarten can produce long-term educational gains, especially for children of color and children from families with low incomes.¹⁴ The majority of five-year-olds (82.7 percent) in kindergarten are enrolled in a full-day program; however, access to full-day kindergarten is only guaranteed in 17 states and the District of Columbia.¹⁵

The high cost of child care and lack of early childhood investments leave many children without quality care during critical years of brain development. We must ensure every child has the head start they need through access to a continuum of high-quality, comprehensive early childhood opportunities starting at birth. To do this, Congress must ensure child care providers have the immediate support needed to keep from permanently closing during the pandemic and states have the long-term funding needed to reconstruct a child care infrastructure that better serves all children and families.

The Child Care Crisis Creates Impossible Decisions for Families

In May 2020, Cristina Guajardo of Austin, TX, was let go from her job and unable to start a new job until her two-year-old's subsidized daycare was able to reopen. Cristina turned down job opportunities as bills continued to pile up and was forced into the impossible decision between caring for her child and beginning a much-needed new job.¹⁶

The COVID-19 pandemic has made it clear that child care providers are not only essential for the development and education of our next generation, but for parents like Cristina who have been forced to choose between working to keep food on the table and provide for their families and staying home to care for their children as many child care providers don't have the resources they need to safely stay open. Child care is also essential for our healthcare workers, United States Postal Service (USPS) workers, and other workers providing essential services we all depend on to keep our economy running. This burden has fallen especially hard on our nation's mothers as 2.2 million women have left the workforce since the pandemic began, largely due to caregiving responsibilities;¹⁷ mothers could face \$64.5 billion in lost wages and economic activity with continued inaction.¹⁸

With months-long child care closures and little federal relief to date, as many as 4.5 million child care slots could be permanently lost due to the pandemic—a loss that is estimated to impact at least 2.25 million families.¹⁹ Many child care providers—including those that have contributed their own funds and faced growing debt to ensure they have the resources they need to stay safe while caring for our children—continue to face economic destabilization and permanent closures.²⁰ Our child care system was struggling long before the pandemic and we must ensure the system is strengthened and has the necessary funding and support that recognizes it as the as the necessity it is for families, businesses, and our economy.

25

EDUCATION

14 MILLION

STUDENTS ATTEND SCHOOLS WITH POLICE BUT NO COUNSELOR, NURSE, PSYCHOLOGIST, OR SOCIAL WORKER.

All children deserve to attend diverse, well-funded schools where they feel safe and protected, where they have access to high-quality educators and resources, and where their education is culturally responsive, developmentally appropriate, and intellectually stimulating. They have a right to the robust enforcement of our nation's civil rights and education laws and their education must be free from discrimination.

Unfortunately, this is not the reality for too many students. While COVID-19 has crippled our country's public education system even further, America's schools were deeply segregated and inequitable long before the pandemic. Poor children and children of color are likely to already be behind their wealthier and white peers when they start school, and as they progress through schools with smaller budgets and fewer educational resources, it is too often impossible to catch up.

- Less than half of children born into household and neighborhood poverty are ready for school at age five compared with 78 percent of their wealthier peers.¹
- More than 75 percent of lower-income fourth and eighth grade public school students were not proficient in reading or math in 2019, compared with less than 50 percent of higher-income fourth grade and less than 55 percent of higher-income eighth grade students (see **Table 21**).
- More than 77 percent of Hispanic and more than 79 percent of Black fourth and eighth grade public school students were not proficient in reading or math in 2019 compared with less than 60 percent of white students (see **Tables 22-23**).
- During the 2017-2018 school year, 19 percent of Black, 21 percent of Hispanic, and more than 26 percent of American Indian/Alaska Native public school students did not graduate on time compared with only 11 percent of white students (see **Table 24**).

Students of color in schools that are highly segregated along racial and economic lines have significantly less access to highly-qualified and experienced teachers and high-quality educational resources. Academic indicators such as standardized test scores and graduation rates indicate that learning suffers accordingly.

- Only 1 in 8 white students attends a school where the majority of students are Black, Hispanic, Asian, or American Indian, whereas nearly 7 in 10 Black children attend such schools.²
- Every school district in the U.S. where segregation is high or even moderate has a large achievement gap.³
- In 2017, 60 percent of Black children attended high-poverty schools with a high share of students of color while fewer than 9 percent of white children did.⁴

Large disparities in school funding mean that children living in lower-wealth areas—often children of color and children growing up in poverty—also attend under-funded schools that have fewer high-quality teachers, fewer curricular resources, larger class sizes, and less student support.

- As of 2015, only 12 states distributed more funding to high-poverty school districts than low-poverty districts. In many states, the wealthiest districts spend as much as two-to-three times what poorer districts spend per pupil.⁵
- Many states cut funding for education due to the Great Recession in 2008, and as of 2017, K-12 funding in 22 states and the District of Columbia remained below pre-recession levels.⁶
- Studies suggest that a 25 percent increase in per-pupil spending during all 12 years of a child's education could eliminate the average secondary education achievement gap between lower-income and higher-income children.⁷

EDUCATION

Too many students, especially students of color, face exclusionary discipline policies that threaten to derail their education or over-policed schools that put their very safety at risk.⁸ Over the last decade, schools have increased investment in school policing under the guise of making them safer for students. However, police in schools do not necessarily make children safer, but rather contribute to the school-to-prison pipeline and continue to disproportionately deny Black children, Latino children, and children with disabilities the opportunity to succeed.⁹

- During the 2015-2016 school year, the suspension rate for Black students in public school was more than four times that for white students (see **Table 26**).
- Fourteen million students attend schools with police but no counselor, nurse, psychologist, or social worker. This is despite evidence that schools with these types of supports "see improved attendance rates, better academic achievement, and higher graduation rates, as well as lower rates of suspension, expulsion, and other disciplinary incidents."¹⁰
- While students with disabilities made up only 12 percent of students during the 2015-2016 school year, they comprised 26 percent of students who received out-of-school suspensions.¹¹

Children who are experiencing homelessness, in foster care, or returning from juvenile detention are especially likely to be educationally disadvantaged and are less likely to graduate from high school.

- The estimated national graduation rate for students experiencing homelessness is only 67.5 percent, as compared to the overall national average for all students which is 85.3 percent.¹²
- Because of the lack of adequate supports, students in foster care are more likely to be suspended or expelled, to score lower on standardized tests in reading and math, to be involved in special education, and to have higher rates of grade retention and drop out, and are less likely to attend and graduate from college.¹³
- Without adequate educational resources, young people in juvenile justice facilities are chronically behind in school and make no meaningful progress in academic achievement while incarcerated. Approximately 2 in 3 drop out of school after exiting the juvenile justice system.¹⁴

When we deny our children the education to which they have every right, we deny them the chance they deserve to have a bright future. We must continue to work to equitably distribute educational resources, eliminate segregation and gross inequities in school funding, and eliminate discriminatory education policies that undermine equal opportunities for all students.

COVID-19 Leaves Marginalized Students Disconnected and Behind

The COVID-19 pandemic has caused an education crisis that will impact this generation of students for the rest of their lives. While many school districts provided some distance learning opportunities during the 2019-2020 school year, children with disabilities, children from low-income and unemployed families, children living in rural communities, and children of color faced many barriers to accessing this modified education—including insufficient internet access, lack of support for online learning due to parent work schedules, and inability to effectively learn via modified formats, among others.

Too many students could not access modified education or lived in districts where no instruction was offered after schools closed for the last several months of the 2019-2020 school year.¹⁵ A survey of close to 1,600 families found that parents with low incomes were "10 times more likely to say their kids are doing little or no remote learning," and children with Individualized Educational Program accommodations (which includes many students with disabilities) are "twice as likely as their peers to be doing little or no remote learning."¹⁶ This untenable situation has carried into the 2020-2021 school year in districts across the country.

The State of America's Children® 2021

CHILD WELFARE

A CHILD IS REMOVED FROM THEIR HOME AND PLACED INTO FOSTER CARE EVERY TWO MINUTES.

The child welfare system is in the midst of a paradigm shift that recognizes the critical importance of supporting families so children can remain safely at home and foster care is used only as a last resort. With the historic passage of the Family First Prevention Services Act (Family First) in 2018, states and tribes can now utilize guaranteed child welfare funds to provide certain evidence-based services and programs to stabilize families and prevent the need for foster care.¹ However, Family First, which is still in early stages of implementation, is just the first step to ensure children can thrive with their families.

The U.S. has deeply underinvested in the upstream services that support families and keep them strong, services that extend well beyond the bounds of the formal child welfare system and into housing, economic support, and other critical services, and this was exacerbated in 2020 by the COVID-19 pandemic. By investing in keeping families strong, we can prevent child maltreatment and give all children the opportunity to thrive.

In 2019, 651,505 children were victims of abuse or neglect, a decrease of 21,643 compared to the previous year (see **Table 27**). That means, on average, a child is abused or neglected every 48 seconds in America, 1,785 each day.² More than half of all child maltreatment cases in 2019 involved children who were six years old or younger, with 14.9 percent of cases involving infants under one.³ Of these children, 251,359 entered foster care.⁴

- Neglect, often a proxy for the consequences of poverty, was the most common reason for children entering the child welfare system. Neglect was associated with a child's removal in 63 percent of cases. Issues related to unsafe or substandard housing were associated with 10 percent of child removals.⁵
- After steadily rising every year since 2008, the proportion of child removals in which parental drug abuse played a role declined in 2019. Parental drug abuse is partly responsible for 34 percent of child removals, while alcohol abuse played a role in 5 percent of child removals.⁶
- A common misconception is that physical and sexual abuse are the primary drivers of child welfare involvement, though these serious forms of abuse factor into a smaller portion of cases. Physical abuse was associated with 13 percent of removals and sexual abuse four percent.⁷

Children in foster care are among the most vulnerable children in America. There were 423,997 children in care in 2019 (see **Table 28**), 41 percent of whom were under the age of six.⁸ These children spend an average of 19.6 months in foster care, with 14 percent spending more than three years in the system.⁹ Children of color, particularly Black and American Indian/Alaska Native children, are dramatically overrepresented in the child welfare system. Of every 1,000 white children in the United States, 5.2 are in foster care, compared with 9.9 of every 1,000 Black children and 16.9 of every 1,000 American Indian/Alaska Native children.¹⁰

- Nationally, Black children, are represented in foster care at a rate that is 1.66 times their portion of the overall population, and in 18 states at a rate that is more than double (see **Table 29**).
- American Indian/Alaska Native children are represented in foster care at a rate that is 2.84 times their portion of the population nationally. This disproportionality varies by state, with 11 states where the percent of the foster care population that is American Indian/Alaska Native is more than double the percent of the overall child population that is American Indian/Alaska Native, including one state where it is more than 15 times as high (see **Table 29**).

Children do best when placed with families, preferably their own relatives, but some require a level of mental or behavioral health treatment that can only be provided in a congregate (non-family) setting, such as a group home or child care institution. Congregate care is meant to be temporary treatment, but children are often inappropriately placed in these settings without a clinical need or are held long after their clinical needs are met.

CHILD WELFARE

- Nationally, 11 percent of children in foster care are placed in congregate care settings, with up to 27 percent of children in congregate care in certain states (see **Table 30**). While this number has been steadily decreasing, the number of children in congregate care increased in 19 states between 2017 and 2018.¹¹
- More than 2.6 million children live in households headed by grandparents or other relatives without their parents present.¹² Approximately 133,000 children in foster care are placed with relatives, and the remainder of these kinship placements occur outside of the child welfare system with little or no government support.¹³

Foster care is intended to be temporary, with the ultimate goal of returning children safely home to their families. When this is not possible, children must be placed into permanent homes, either through adoption, guardianship, or other arrangements with relatives. In 2019, 248,669 children left foster care after an average of 20 months in care.¹⁴

- In 2019, only 47 percent of children exiting foster care were reunified with their families, the lowest percentage ever recorded (see **Table 31**).
- In 2019, 64,415 (26 percent) children were adopted out of the child welfare system, the highest number recorded,¹⁵ and 122,216 children were waiting to be adopted.¹⁶
- After steadily declining since 2008, the number of children aging out of foster care jumped by more than 14 percent in 2019, with 20,445 youth reaching adulthood without a permanent family.¹⁷ When the system fails to find permanent homes for youth, they are significantly more likely to experience homelessness, unemployment, and incarceration.

More resources are needed to ensure that every child can grow up in a safe, stable, and loving family. By dramatically increasing investments in family support, we can keep families strong and prevent the need for foster care. Making this early investment will free up necessary resources to improve the child welfare system for the families that do need it, including specialized treatment services to help children heal from the trauma they have experienced and robust supports to help families reunify safely.

COVID-19 Places Unprecedented Stresses on Children, Families, and the Child Welfare System

Stressors caused by the COVID-19 pandemic that are detailed throughout this report —economic, housing, and food insecurity, school and child care closures, and decreased access to services and supports—are testing the resilience of families. Stress directly impacts the ability of parents to safely care for their children and an overload of stressors without sufficient support contributes to child maltreatment.¹⁸ As the pandemic places unprecedented stress on families, it also made it more difficult for them to access the services that help them to remain strong. In response, the child welfare system has had to rapidly adapt to help children remain safe with their families.

The pandemic weighed especially heavily on older youth in extended foster care and on youth who have recently aged out as they often lack the resources and connections that other young people have relied on to weather this crisis and face staggering levels of job loss and food insecurity.¹⁹ Additionally, kin caregivers, especially the approximately 2.5 million kin caregivers raising children outside the formal child welfare system, have been made particularly vulnerable as they are disproportionately older and at high risk from the virus.²⁰

The pandemic has laid bare the fact that too many families were in a precarious position before the pandemic began. It has made clear that we must invest in the strong families and communities that keep children safe.

29

YOUTH JUSTICE

1,909

CHILDREN ARE ARRESTED EACH DAY IN THE U.S.

The number of children arrested and incarcerated has declined over the past decade, largely due to positive changes in policy and practice. However, America's children continue to be criminalized at alarming rates and disparities have persisted. Many children—particularly children in poverty; children of color; children with disabilities; children with mental health and substance abuse challenges; children subjected to neglect, abuse, and/or other violence; children in foster care; and LGBTQ children—are pushed out of their schools and homes into the juvenile justice or adult criminal justice systems.

- In 2019, 696,620 children were arrested in the U.S. (see **Table 32**). A child or teen was arrested every 45 seconds despite a 62 percent reduction in child arrests between 2009 and 2019.¹
- During the 2015-2016 school year alone, there were over 61,000 school arrests and 230,000 referrals to law enforcement, largely overrepresented by students with disabilities, Black students, and Indigenous students. The prioritization of police over mental health professionals in schools often leads to the criminalization of typical adolescent behavior and fuels the school-to-prison pipeline. Today, 14 million students attend schools with police but no counselor, nurse, psychologist, or social worker.²
- Although the number of children in the juvenile justice system has been cut in half since 2007, 43,580 children and youth were held in residential placement on a given night in 2017. Nearly 2 in 3 were placed in the most restrictive facilities.³
- Another 653 children were incarcerated in adult prisons on any given night in 2019—down from 2,743 in 2009 (see **Table 33**).
- Despite research showing that young people's brains continue to develop and mature through their late teens and into their mid-twenties,⁴ young adults do not often have access to the age- and developmentally- appropriate policies and resources they need. Adolescents and young adults often "age out" of offending; however, as of 2021, 46 states and the District of Columbia automatically prosecute 18-year-olds as adults and 3 states automatically prosecute 17-year-olds as adults (Vermont is the first and only state to expand juvenile court jurisdiction to 18). All states also allow or require younger children charged with certain offenses to be prosecuted in adult court.⁵

Even as child arrests and detentions have fallen, extreme racial disparities have persisted across the juvenile and adult criminal justice systems. Children of color, particularly Black children, continue to be overcriminalized and overrepresented at every point—from school discipline and arrest to sentencing and post-adjudication placements.

- Although 63 percent of children arrested in the U.S. were white, American Indian children were 1.5 times more likely to be arrested and Black children were 2.4 times more likely to be arrested than white children.⁶
- In 2017, the residential placement rate for children of color was two times higher than that of white children nationwide: Hispanic children were 1.4 times more likely, American Indian children were 2.8 times more likely, and Black children were 4.6 times more likely to be committed or detained than white children. In 18 states and the District of Columbia, the residential placement rate for children of color was four times higher than that of white children.⁷
- Two-thirds (67 percent) of children in the juvenile justice system were children of color: 41 percent were Black and 21 percent were Hispanic (see **Table 34**).
- Children of color are also disproportionately transferred to the adult criminal justice system, where they are tried and prosecuted as adults. In 2018, Black youth represented less than 15 percent of the total youth population but 52 percent of youth prosecuted in adult criminal court.⁸ Black youth are nine times more likely than white youth to receive an adult prison sentence, American Indian/Alaska Native youth are almost two times more likely, and Hispanic youth are 40 percent more likely.⁹

Boys, youth with disabilities, and LGBTQ youth also come into disproportionate contact with the juvenile and adult criminal justice systems.

- In 2017, the residential placement rate for boys was more than five times that for girls. Eighty-five percent of children in residential placement were male.¹⁰
- At least 1 in 3 youth in the juvenile justice system has a disability qualifying them for special education services under the Individuals with Disabilities Education Act (IDEA)—nearly four times the rate of youth in public schools. However, less than half receive special education services while in custody.¹¹
- The percent of LGBTQ children in the juvenile justice system (20 percent) is more than two times that of LGBTQ youth in the general population (7-9 percent); 85 percent are LGBTQ children of color.¹²

Children do not belong in prisons. Incarceration does not support the growth and development of our children; it places them at risk and limits their access to resources.

- While incarcerated, children are often provided with inadequate education instruction, health care, and counseling services and they are at greater risk of maltreatment, physical and psychological abuse, sexual assault, and suicide.¹³
- The use of solitary confinement further deprives them of social interaction, mental stimulation, and key services during a critical time of adolescent brain development. Youth of color and LGBTQ youth are at heightened risk of being placed in solitary confinement and youth with disabilities are often placed in isolation due to lack of available services or accommodations—when no child should be placed in solitary confinement regardless of identity.¹⁴
- Risks are heightened for children in the adult criminal justice system, which is even more focused on punishment rather than rehabilitation and treatment. Children in adult jails are more likely to suffer permanent trauma and are five times more likely to die by suicide than children held in juvenile detention centers.¹⁵

As youth crime and arrest rates continue to decline, now is the time to re-imagine youth justice. We have better choices than incarceration: diversion, treatment, after school programs, and family support programs support children, keep communities safe, and save taxpayer dollars. It is time to end the criminalization of children and provide every child time and space for learning, mistakes, and restorative support from caring adults.

COVID-19 Magnifies the Harms of Incarceration

With continued reliance on criminalization and incarceration, our nation's children—especially Black children—are being put at risk of lasting harm to their health, development, and well-being instead of receiving the resources and supports they need. This is especially true amid the ongoing pandemic.

Latoyia Porter of Louisiana is filing early release papers for her son, Treyjon. "We can do more for him on this side of the facility. He's already served five years for vehicular theft, a non-violent crime," she said. "With no rehabilitation services, what's the point of having him in there?" Treyjon and other young people detained in Louisiana have had their rehabilitation services suspended; have been pepper sprayed by untrained temps; and have been denied COVID-19 tests despite having symptoms. "It's really hard for a mother not to be in control of her child's healthcare," Latoyia explains.¹⁶

Living in congregate care settings with inadequate resources puts children like Treyjon at great risk of COVID-19. As of late February 2021, more than 3,750 young people in juvenile facilities and even more staff have been diagnosed with coronavirus across 41 states, the District of Columbia, and Puerto Rico.¹⁷ The roughly 44,000 incarcerated children across the country are living in fear of COVID-19 and are facing solitary confinement as a form of social distancing, limited access to PPE, limited or no visitations or contact with loved ones, and limited educational and recreational activities. To date, their needs have largely been ignored by federal lawmakers as they have crafted legislation to respond to the crisis.

The State of America's Children® 2021

GUN VIOLENCE

IN 2019, A CHILD OR TEEN WAS KILLED WITH A GUN EVERY 2 HOURS AND 36 MINUTES

Ven before COVID-19, another epidemic was killing our children at higher rates: gun violence. Gun violence was the leading cause of death for all children and teens ages 1-19 in 2018, surpassing motor vehicle accidents for the first time in history.¹ Children and teens are far more likely to die from gunfire than COVID-19,² yet our leaders continue to allow gun violence to go uncurbed and gun laws to go unchanged.

After years of congressional inaction, a growing number of children are paying with their lives. In 2019, 3,371 American children and teens were killed with guns—enough to fill more than 168 classrooms of 20 (see **Table 35**).

- Child and teen gun deaths hit a 19-year high in 2017 and have remained elevated since.³
- In 2019, nine children and teens were killed with guns each day in America—one every 2 hours and 36 minutes.⁴
- Guns killed more children and teens than cancer, pneumonia, influenza, asthma, HIV/AIDs, and opioids combined.⁵
- While mass shootings grabbed fleeting public and policymaker attention, routine gunfire took the lives of more children and teens every week than the Parkland, Sandy Hook, and Columbine massacres combined.
- Since 1963, nearly 193,000 children and teens have been killed with guns on American soil more than four times the number of U.S. soldiers killed in action in the Vietnam, Persian Gulf, Afghanistan, and Iraq wars combined.⁶

Shamefully, gun deaths reflect only part of the devastating toll of America's growing gun violence epidemic. Many more children and teens are injured than killed with guns each day in our nation.

- For every child or teen fatally shot, another 5 suffered non-fatal gunshot wounds.⁷
- An estimated 16,644 children and teens were injured with guns in 2018—one every 32 minutes.⁸

Gun violence affects all children, but children of color, boys, and older youth are at greatest risk.

- Black children and teens had the highest gun death rate in 2019 (11.9 per 100,000) followed by American Indian/Alaska Native children and teens (6.4 per 100,000).⁹
- Although Black children and teens made up only 14 percent of all children and teens in 2019, they accounted for 43 percent of child and teen gun deaths.¹⁰
- Black children and teens were four times more likely to be killed with guns than their white peers.ⁿ
- Eighty-six percent of children and teens who died from gunfire in 2019 were boys. Boys were six times more likely than girls to die in gun homicides. Black boys were 18 times more likely to be killed in gun homicides than white boys.¹²
- Eighty-five percent of child and teen gun deaths occurred among 15- to 19-year-olds, but infants and toddlers were far from immune. Guns killed more preschoolers than law enforcement officers in the line of duty. In 2019, 86 children under 5 were killed with guns compared with 51 law enforcement officers in the line of duty.¹³

No child is safe in a nation with easy access to deadly weapons. Even before the pandemic drove up fear and gun sales, there were too many firearms in our homes and streets—and a shocking number were sold without background checks.

• As of 2017, American civilians owned 393 million firearms—more than one gun per person. In contrast, U.S. military and law enforcement agencies possessed 5.5 million.¹⁴

GUN VIOLENCE

- Americans accounted for less than five percent of the global population, but owned nearly half (46 percent) of all civilian guns in the world.¹⁵
- Nearly 1 in 5 guns are sold without a background check due to a loophole in federal law exempting sales at gun shows, online, or between private individuals.¹⁶

Children are learning there are no safe spaces in our gun-saturated nation. Many children even live in homes with loaded, unlocked guns and know where they are kept. Too often, this leads to tragic accidents and preventable deaths. With a growing number of children learning and playing at home during COVID-related closures, the risk of gun accidents and suicides has only increased.

- A third of households with children have a gun and nearly half of gun-owning households with children do not store all of their firearms safely.¹⁷
- An estimated 4.6 million children live in homes with at least one unlocked and loaded gun—and most children know where these guns are kept.¹⁸ About 3 in 4 children ages 5-14 with gun-owning parents know where firearms are stored and more than 1 in 5 have handled a gun in the home without their parents' knowledge.¹⁹
- Guns in the home are more likely to endanger than protect loved ones. The presence of a gun in the home makes the likelihood of homicide three times higher, suicide three to five times higher, and accidental death four times higher.²⁰
- Eight children and teens are killed or injured in accidental shootings involving an improperly stored gun each day in America.²¹

It is long past time for leaders to end America's gun violence epidemic. Congress must urgently pass common-sense gun safety measures like universal background checks and child access prevention laws to protect children from firearms in their homes, schools, and communities. All children deserve the chance to live, learn, and play safely—free from violence and fear.

COVID-19 is Magnifying Our Gun Violence Epidemic and Highlighting the Need for Immediate Reform

The pandemic has created and exacerbated so many crises for children and families and gun violence is no exception. Unprecedented increases in gun sales—coupled with financial insecurity, social isolation, and other stressors—are magnifying America's gun violence crisis.

- Nearly two million guns were sold in March 2020 alone—the second highest number of guns ever sold in a single month—and this disturbing trend continued in the months that followed.²²
- Even with much of the country on lockdown, mass shootings hit a record high in 2020. Children witnessed, suffered, or died in 611 mass shootings in 2020—up from 417 in 2019.²³
- Gun accidents in the home have also surged during the pandemic. School and child care closures have exacerbated children's risk of dying in gun accidents at home. Between March and May 2020, accidental gun deaths by children increased by 30 percent relative to rates over the past three years.²⁴
- The pandemic has also intensified factors that contribute to gun-related domestic violence and community violence: job losses and financial insecurities have left victims of domestic violence more vulnerable to harm as well as fueling community gun violence.²⁵

The COVID-19 crisis has exposed the consequences of our nation's longstanding failure to pass policies to keep children safe where they live and learn. Our leaders must not only advance meaningful solutions to address the COVID-19 crisis but also the ongoing gun violence crisis in America. We cannot allow children to die at the hands of these crises.

IMMIGRANT CHILDREN

1 in 4

CHILDREN IN THE U.S.— APPROXIMATELY 18 MILLION—ARE CHILDREN OF IMMIGRANTS.

mmigrants are a part of our families, workplaces, and houses of worship. They are friends and neighbors woven into the fabric of our communities. Critically, they are parents tucking children into bed each night.¹ More than 1 in 4 (26 percent), or approximately 18 million, U.S. children lived with at least one immigrant parent in 2018.² For America to flourish and prosper, we must commit to policies that promote all children's well-being and center children of immigrants in these policies.

In direct opposition to children's well-being, the Trump administration's four-year legacy of dangerous, reckless policy choices has created a climate of confusion, fear, and impossible choices. The administration continuously attacked family unity, a foundational principle of child welfare protected by the U.S. Constitution.³

- Family separation is dangerous to children's health, development, and well-being.⁴ Yet during the enforcement of the administration's Zero Tolerance policy between April and June 2018, the government took 4,500 children from their parents.⁵ Although a court order forced the administration to end the policy in June 2018, 1,100 more children were taken from their parents between June 2018 and November 2019.⁶ As of October 2020, the parents of 545 children taken from their families cannot be found.⁷
- Family separation is still happening. Today, there are fresh threats of separations due to the Remain in Mexico program, which has trapped nearly 60,000 people in terrible conditions at the U.S. border as they are forced to wait for their immigration proceedings in Mexico.⁸ Parents are faced with the impossible choice between an indefinite wait in dangerous tent camps and sending their children alone across the border.⁹
- Parents detained together with their children in the U.S. have also faced family separation. In May 2020, families told their lawyers that ICE officers asked them to make the unconscionable choice of either separating from their children or staying in indefinite detention during a global pandemic.¹⁰

Family separation as well as the battle over the border wall and who will pay for it have been highly visible horrors, but the Trump administration's less visible shifts in regulatory and executive action also erected barriers to critical, life-saving benefits and services, affecting the lives of millions in the U.S.¹¹ What does that "invisible wall" look like?

A hungry child.

- Fear and confusion—known as the chilling effect—over intentionally complex Trump administration
 "public charge" regulations are causing families to disenroll or forgo health care, nutrition, public service,
 and other economic support programs.¹² For example, between 2016-2019, Texas experienced a precipitous
 drop in enrollment in benefit programs,¹³ including a 13.5 percent drop in SNAP enrollment between
 December 2017 and April 2019.¹⁴ A qualitative study of 32 geographically diverse organizations in Texas by
 CDF-Texas found that anti-immigrant policies such as public charge caused many mixed-status families
 to fear enrolling even their citizen children.¹⁵
- A nationally representative survey found that 11.4 percent of adults in immigrant families with children reported they or a family member avoided a nutrition program (SNAP or WIC) in 2019.¹⁶

Children's Defense Fund

A child without access to health care.

- More than 1 in 4 immigrant children did not have health coverage in 2019 (25.5 percent compared to 5.1 percent of native-born citizen children).¹⁷
- As of January 2020, 35 states and the District of Columbia provided health coverage to lawfully residing immigrant children without a five-year wait,¹⁸ and as of July 2019, six states and the District of Columbia use state-only funds to provide Medicaid coverage to income-eligible children regardless of immigration status.¹⁹

A scared child.

- Children's feelings of personal safety are linked to the perceived safety of those who care for them.²⁰
 Chronic uncertainty and distress about the threat of enforcement activity destroy children's sense of safety and their mental health.²¹ The Trump administration's aggressive enforcement choices, including continuous threats to DACA, heightened fears of deportation.
- More than 250,000 children in the U.S. have at least one parent who is a DACA recipient.²²
- An estimated 6.9 million children lived with undocumented parents.²³

Beyond tearing down the harmful policies that separate families and chill access to critical services, we must lean forward and build a permanent solution to this nation's immigration crisis so that every child has the opportunity to grow up in a safe, stable, and loving family and community.

Immigrant Families are Essential Members of Our Communities and Must Be Prioritized in COVID-19 Relief

Right now, immigrant workers are at the frontlines of the COVID-19 crisis, keeping all of us healthy, fed, and cared for in health care, retail, manufacturing, and other essential industries.²⁴ In recognition of the critical role immigrant families play in our communities, Congress must ensure that COVID relief packages are inclusive of our immigrant children and families.²⁵

For example, our leaders have the opportunity to make economic stimulus payments inclusive and fair. Immigrants and their families must be included in any new COVID stimulus payments and receive retroactive stimulus from when they were cut out of relief last year—regardless of the kind of taxpayer identification they use.

COVID relief, including economic stimulus payments, help families make ends meet during this crisis, and it is well established that cash assistance also supports children's well-being and healthy development.²⁶ Our leaders must act swiftly to ensure the next COVID relief package is the most robust and inclusive yet.

35

TABLES

In 2019, children of color made up nearly 50 percent of the total U.S. child population and more than half the child population in 11 states and the District of Columbia.

Table 1: Child Population by Age and Race/Ethnicity, 2019

| | | | Percent of Children Who Are: | | | | | | | |
|----------------------|-------------------|-------------------------|------------------------------|--------------|----------|-------------|-------------|-------------------------|---|--|

Table 2: Poor Children in America in 2019—A Portrait

^a Percentages calculated relative to the number of poor children related to the head of household (10,177,000) rather than the total number of poor children (10,466,000).

^b Percentages calculated relative to the number of poor children in related families (10,165,000) rather than the total number of poor children (10,466,000).

Notes: A family of four was considered poor in 2019 with an annual income below \$26,370 and extremely poor with an income below half that amount (\$13,185). Poverty estimates differ based on the source of the Census data. Census data on poverty is collected through both the American Community Survey (ACS) and the Current Population Survey (CPS). The CPS provides the most accurate national data on poverty and is therefore the official source of national poverty estimates. The ACS uses a larger sample size and is therefore preferred for state-level poverty data. All racial categories exclude children of Hispanic ethnicity. Hispanic children can be of any race.

Sources: U.S. Census Bureau, Current Population Survey. 2020. "2019 Annual Social and Economic Supplement," Tables POV01, POV03, POV03, POV13, POV21, POV40. https://www.census.gov/topics/income-poverty/data/tables.html. Additional customized tables generated using MDAT. https://data. census/gov/mdat/#/.

The federal government uses different guidelines for determining who is considered poor and who is eligible for public benefits. In 2019, a family of four was considered poor if their annual income fell below \$26,172 and extremely poor if their income fell below half that amount. A family of four was considered eligible for public benefits if their annual income fell below \$25,750.

^a The federal poverty thresholds are used to calculate those who are considered poor and extremely poor. The poverty threshold numbers in the table are weighted averages of the actual thresholds. The actual poverty thresholds vary slightly based on the number of children and, for households of size one and two, whether the houshold includes someone over 64. Except for Alaska and Hawaii, which have slightly higher thresholds, no adjustments are made for differences in living costs from state to state. Extreme poverty is defined as half of the poverty thresholds.

^b The federal poverty guidelines (also called the Federal Poverty Level) are a simplification of the poverty thresholds used to determine eligibility for public benefits and are adjusted annually to account for inflation.

Notes: Poverty estimates differ based on the source of Census data. Census data on poverty is collected through both the American Community Survey (ACS) and Current Population Survey (CPS). The CPS provides the most accurate national data on poverty and is therefore the official source of national poverty estimates. The ACS uses a larger sample size and is preferred for state-level poverty data. For national estimates, all racial categories exclude children of Hispanic ethnicity. For state estimates, only the "White" racial category excludes children of Hispanic ethnicity. Hispanic children can be of any race. The racial categories Asian, Native Hawaiian, and Other Pacific Islander are combined because disaggregated data were not available.

Table 5: Percent of Poor Children by Race/Ethnicity, 2019

Notes: Poverty estimates differ based on the source of Census data. Census data on poverty is collected through both the American Community Survey (ACS) and Current Population Survey (CPS). The CPS provides the most accurate national data on poverty and is therefore the official source of national poverty estimates. The ACS uses a larger sample size and is preferred for state-level poverty data. For national estimates, all racial categories exclude children of Hispanic ethnicity. For state estimates, only the "White" racial category excludes children of Hispanic ethnicity. Hispanic children can be of any race. The racial categories Asian, Native Hawaiian, and Other Pacific Islander are combined because disaggregated data were not available for most states. "N/A" means data were not available.

In 2019, more than 1 in 6 children were poor in 21 states and the District of Columbia.

*States are ranked 1 to 50 with 1 meaning the lowest child poverty rate and 50 meaning the highest child poverty rate.

Notes: Poverty estimates differ based on the sources of Census data. Census data on poverty is collected through both the American Community Survey (ACS) and Current Population Survey (CPS). The CPS provides the most accurate national data on poverty and is therefore the official source of national poverty estimates. The ACS uses a larger sample size and is preferred for state-level poverty data.

In 2019, the median income of Black (43,900), Hispanic (52,300) and American Indian (48,000) families with children was about half the median income of white families with children (95,700).

Table 7: Median Family Income among Households with Children by Race/Ethnicity, 2019

Notes: "S" means estimates were suppressed when confidence interval around the percent was greater than or equal to 10 percentage points. Racial/ ethnic categories are presented in the order of their share in the child population. The racial category, "White," excludes children of Hispanic ethnicity while the racial categories, "Black," "Asian/Pacific Islander," "Two or More Races" and "American Indian" include children of Hispanic ethnicity.

Table 8: Rental Housing Affordability, FY2020

^a In these states federal minimum wage law supersedes state minimum wage laws because the federal minimum wage is greater than the state minimum wage or there is no state minimum wage.

^b As of July 1, 2020, Nevada raised the minimum wage to \$8.00 for employees with health insurance and \$9.00 for employees without health insurance. Notes: Affordability is defined as rent not being more than 30 percent of monthly income. Fair Market Rent (FMR) is the 40th percentile of gross rents for typical, non-substandard rental units. It is calculated annually by the Department of Housing and Urban Development.

^a Food-insecure households are households with children that had difficulty meeting basic food needs for adults, children or both.

^b States are ranked 1-50 with 1 meaning the lowest percent of children living in food-insecure households and 50 meaning the highest percent of children living in food-insecure households.

"Household Food Security in the United States in 2019 Statistical Supplement," Table S-3. Washington, DC: United States Department of Agriculture. https:// www.ers.usda.gov/webdocs/publications/99289/ap-084.pdf?v=7883.8. More than 21.6 million children received free or reduced-price lunch during the 2018-2019 school year, but less than 3 million of them received meals in summer 2019. In 44 states, more than 4 in 5 children who received free or reduced-price lunch did not participate in Summer Nutrition Programs.

| United States | 21,619,624 | 12,434,975 | 2,774,183 | 12.8 % | |

^a States are ranked 1-50 with 1 meaning the highest percent of children who receive free or reduced-price lunch also participated in Summer Nutrition Programs and 50 meaning the lowest number of children who receive free or reduced-price lunch also participate in Summer Nutrition Programs.

^b In these states, 50 percent or more of eligible school districts adopted the Community Eligiblity Provision for the 2018-2019 school year. These high poverty school districts offered breakfast and lunch at no charge to all students without having to collect and process individual meal applications.

Note: Participation data are based on average daily meals served from September through May for the School Lunch and Breakfast Programs and in July for the Summer Food Service Program.

Table 14: Children Uninsured and Enrolled in Medicaid/CHIP, 2019^a

^a Uninsured at the time of the survey, not necessarily for the entire year. These numbers are among children ages 0-18.

^b Calculations were based on a comparison with data from 2018 American Community Survey 1-Year Estimates, Table B27001- Health Insurance Coverage Status by Sex by Age

^c States are ranked 1-50 with 1 meaning the highest percent of children who are uninsured and 50 meaning the lowest percent of children who are uninsured.

^d These states had expanded Medicaid to 138 percent of the FPL for all eligible adults in the state as of January 2020. When parents are covered, their children are more likely to also be covered. An asterisk (*) denotes the state has expanded Medicaid between January 2020 and January 2021.

^a Highest level of income eligibility for Medicaid or CHIP as a percent of the federal poverty level (FPL).

^b "Waiting period" refers to the length of time a state requires a child to be uninsured prior to enrolling in CHIP, although every state has exceptions. The ACA prohibited waiting periods longer than 90 days starting in 2014.

c "M" denotes 12-month continuous eligibility for Medicaid. "C" denotes 12-month continuous eligibility for CHIP. "n/a" denotes the state does not provide a separate CHIP program for uninsured children. "n/r" denotes the state did not report.

d These states cover immigrant children who have been lawfully residing in the U.S. for less than five years under the Immigrant Children's Health Improvement Act (ICHIA) option with state funds.

e These states have expanded Medicaid to 138 percent of the FPL for all eligible adults in the state as of January 2020. When parents are covered, their children are more likely to also be covered. An asterisk (*) denotes the state has expanded Medicaid but enrollment for the expansion population will not begin until 2021.

Table 17: Child Care Costs for Infants, 2019

^a A positive percent (higher than 0) means infant center-based care cost more than public college tuition. A negative percent (lower than 0) means infant center-based care cost less than public college tuition.

Notes: "*" means state did not report on the 2020 survey; data reported from state's most recent Market Rate Survey. "n/a" means data was not reported or not available. Source: Child Care Aware of America. 2020. "Picking Up the Pieces: Building a Better Child Care System Post COVID-19," Appendices III, XI, XII, XV. https://www.childcareaware. org/picking-up-the-pieces/.

Although over 812,000 families and 1.3 million children were served each month by the Child Care and Development Fund in FY2018, more than 430,000 subsidies have been lost since 2006—the year before the recession began.

^a Counts for the United States exclude U.S. territories and protectorates. Percents include data from territories and protectorates.

Note: Data are preliminary and subject to change. Racial categories (White, Black, Asian, American Indian/Alaska Native, Native Hawaiian/Pacific Islander, Multi-Racial) include children of Hispanic ethnicity. Percents for racial groups do not add up to 100 percent because of missing data.

Table 20: Enrollment of 4- and 3-Year-Olds in State-Funded Preschool Programs, 2018-2019

^a The National Institute for Early Education Research (NIEER) defines a state preschool program as one serving 3- and 4- year olds that is funded, controlled, and directed by the state. Its primary focus must be early childhood education and it must offer a group learning experience to children at least two days each a week. It may serve children with disabilities but cannot be primarily designed to serve these children. State-funded preschool may be coordinated and integrated with the child care subsidy system in the state. State supplements for Head Start constitute state preschool if they substantially increase the number of children served and involve some state administrative responsibility. NIEER uses 10 benchmarks to measure the quality of state preschool programs: 1) comprehensive early learning and development standards that are horizontally and vertically aligned, supported, and culturally sensitive; 2) supports for curriculum implementation; 3) teachers with bachelor's degrees and 4) specialization in early childhood; 5) assistant teachers with child development associate's or equivalent degrees; 6) at least 15 hours/year of professional development, individualized plans and professional development plans, and coaching for lead and assistant teachers; 7) a maximum class size of 20; 8) child-staff ratios of no more than 10:1; 9) comprehensive vision, hearing, and health screenings; and 10) continuous quality improvement system.

Note: "n/a" means no program.

Notes: Lower-income students are students who qualify for free and reduced-price school lunch, which means their families' incomes are at or below 185 percent of the Federal Poverty Level (FPL). Higher-income students are students who do not qualify, or whose families' incomes are higher than 185 percent of FPL.

^a States are ranked 1-50 with 1 meaning the lowest percent of students performing below proficiency and 50 meaning the highest percent of students performing below proficiency. States with different ranks may have same percents due to rounding.

Note: "n/a" means reporting standards were not met and sample size was insufficient to generate a reliable estimate. Racial categories (White, Black, Asian, Native Hawaiian/ Other Pacific Islander, two or more races) exclude children of Hispanic ethnicity. Hispanic children can be of any race.

^a States are ranked 1-50 with 1 meaning the lowest percent of students performing below proficiency and 50 meaning the highest percent of students performing below proficiency. States with different ranks may have same percents due to rounding.

Note: "n/a" means reporting standards were not met and sample size was insufficient to generate a reliable estimate. Racial categories (White, Black, Asian, Native Hawaiian/Other Pacific Islander, two or more races) exclude children of Hispanic ethnicity. Hispanic children can be of any race.

Adjusted Cohort Graduation Rate (ACGR)

Notes: The ACGR is an estimate of the percent of public school students who receive a regular diploma within four years of entering ninth grade. Racial categories exclude children of Hispanic ethnicity. Hispanic children can be of any race. "S" means data were suppressed to protect the confidentiality of individual student data. The greater than or equal to sign ">" means the estimate has been top-coded to protect the confidentiality of individual student data. "n/a" means data were not available.

^a a States are ranked 1 to 50 with 1 meaning highest ACGR and 50 meaning lowest ACGR.

Source: National Center for Education Statistics. 2019. "Table 1. Public High School 4-Year Adjusted Cohort Graduation Rate (ACGR), by Race/Ethnicity and Selected Demographic Characteristics for the United States, the 50 States, and the District of Columbia: School Year 2017-18." https://nces.ed.gov/ccd/tables/ACGR_RE_and_ characteristics_2017-18.asp.

The U.S. spends far more on incarceration than education. On average, the U.S. spent 2.5 times as much per prisoner as per public school student during 2016-2017.

Table 25: Public Spending on Prisoners vs. Public School Students, 2016-2017

| | Spending Per Prisoner, FY2016 | Spending Per Public School Student, 2016-2017 | Ratio of Spending Per Prisoner vs. Public School Student | Rank by Ratio ^a |
|-----------------------------------|-------------------------------------|---|--|----------------------------|

Percent of Elementary and Secondary Students Receiving at Least One Out-of-School Suspension by Race/Ethnicity

Notes: Data by race/ethnicity exclude students with disabilities served only under Section 504 (not receiving services under IDEA). Racial categories (White, Black, Asian, American Indian/Alaska Native, and Pacific Islander) exclude students of Hispanic ethnicity. Hispanic students can be of any race. Source: U.S. Department of Education, Office for Civil Rights, Civil Rights Data Collection. 2020. "2015-16 State and National Estimations," One or More Out-of-School Suspensions and Enrollment. https://ocrdata.ed.gov/estimations/2015-2016. Calculations made by the Children's Defense Fund.

More than 651,000 children were victims of abuse and neglect in 2019. Nearly 3 in 4 were victims of neglect.

Table 27: Child Abuse and Neglect, 2019

Notes: "n/a" means the category is not reported by state. Percents add up to over 100 percent as some cases involved multiple types of maltreatment. Due to differences in definitions of child maltreatment, data should not be compared between states. Categorization of child maltreatment was analyzed differently for 2019, and data should not be compared to that of previous reports. U.S. total excludes data from Puerto Rico and U.S. territories.

Notes: Data are for children in foster care on September 30, 2018. Racial categories exclude children of Hispanic ethnicity. "n/a" means data were not available. Sources: The Annie E. Casey Foundation, KIDS Count Data Center. 2020. "Children in Foster Care by Race and Hispanic Origin in the United States, 2018." https://datacenter.kidscount.org/data/tables/6246-children-in-foster-care-by-race-and-hispanic-origin; The Annie E. Casey Foundation, KIDS Count Data Center. 2020. "Child Population by Race in the United States, 2018" https://datacenter.kidscount.org/data/tables/103-child-population-by-race.

Between 2008 and 2018, 26 states and the District of Columbia decreased their use of congregate care by at least 33.3 percent. In 14 of these states children in congregate care declined by at least 50 percent. Only two states— Delaware and New Mexico—increased their use of congregate care.

Table 30: Children in Congregate Care and Care with Relatives, 2008 and 2018

Source: The Annie E. Casey Foundation, KIDS COUNT Data Center. 2020. "Children in Foster Care by Placement Type." https://datacenter.kidscount.org/data/ tables/6247-children-in-foster-care-by-placement-type.

Four out of five children exiting foster care were placed in a permanent family in 2018; the majority of children reunited with their families. However, 11 percent of children—nearly 18,000—"aged out" of foster care without a permanent family.

^a Relative to the combined number of children in residential placement who identified as male or female, which may differ from total counts due to rounding. ^b Interpret data with caution. In these states, 30% or more of the information for age, sex, and/or race/ethnicity was imputed.

Notes: Residential placements range from non-secure community-based group homes to long-term secure facilities. Racial categories (White, Black, Asian, and American Indian/Alaska Native) exclude children of Hispanic ethnicity. Hispanic children can be of any race. U.S. totals exclude youth in tribal facilities. Source: Sickmund, Melissa et al. 2019. "Easy Access to the Census of Juveniles in Residential Placement: 1997-2017." http://www.ojjdp.gov/ojstatbb/ezacjrp/.

In 2019, 3,371 children and teens were killed with guns in America. More than half of all child and teen gun deaths occurred in just 10 states: Texas, California, Florida, Illinois, Georgia, Ohio, Missouri, North Carolina, Louisiana and Tennessee.

Table 36: Child and Teen Gun Deaths by State, 2010-2019

^aStates are ranked 1-50 from lowest to highest gun death rate.

Notes: Gun deaths include homicides, suicides, accidents and deaths of unknown intent, but exclude deaths from legal intervention. Rates are not age adjusted. "S" denotes cases where the number of deaths was below 10 and the exact number was not released to protect the anonymity of the victims. "U" means the rate is unreliable because it is based on fewer than 20 deaths.
